## Finite FIELDS

- $q=$ prime number.
- Prime fields $\mathbb{F}_{q}=\{0,1, \ldots, q-1\}(\bmod q)$.
- Binary field $\mathbb{F}_{2}=\{0,1\}$.
- Ternary field $\mathbb{F}_{3}=\{0,1,2\}=\{-1,0,1\}$.
- Finite fields $\mathbb{F}_{q}: q$ prime power.

## POINTS AND LINES

## THEOREM

$P G(2, q)$ has $q^{2}+q+1$ points and $q^{2}+q+1$ lines.

## Proof:

- $\left(q^{3}-1\right) /(q-1)=q^{2}+q+1$ vector lines in $V(3, q)$.
- Vector plane in $V(3, q): a_{0} X_{0}+a_{1} X_{1}+a_{2} X_{2}=0$. $\left(q^{3}-1\right) /(q-1)=q^{2}+q+1$ vector planes in $V(3, q)$.

## Points on Lines

## THEOREM

(1) Two points in $P G(2, q)$ belong to unique line of $P G(2, q)$.
(2) Two lines in $P G(2, q)$ intersect in unique point.

## Proof:

- Two vector lines in $V(3, q)$ define unique vector plane in $V(3, q)$.
- Two vector planes in $V(3, q)$ intersect in unique vector line in $V(3, q)$.

Finite fields

Points and lines
Coordinates

## Points on Lines

## THEOREM

(1) Line of $P G(2, q)$ has $q+1$ points.
(2) Point of $P G(2, q)$ lies on $q+1$ lines of $P G(2, q)$.

## Proof:

- Vector plane of $V(3, q)$ has $q^{2}-1$ non-zero vectors; each vector line has $q-1$ non-zero vectors, so vector plane of $V(3, q)$ has $\left(q^{2}-1\right) /(q-1)=q+1$ vector lines.
- Take vector line $\langle(1,0,0)\rangle$. This lies in vector planes $a_{1} X_{1}+a_{2} X_{2}=0$. Up to non-zero scalar multiple of $\left(a_{1}, a_{2}\right) \neq(0,0)$, these equations define $\left(q^{2}-1\right) /(q-1)=q+1$ vector planes of $V(3, q)$.

## Points and lines

Coordinates

## The Fano Plane PG(2, 2)

Finite fields

Points and lines
Coordinates

## Properties of Fano plane

- $\operatorname{PG}(2,2)$ has 7 points:
$\left\langle\left(a_{0}, a_{1}, a_{2}\right)\right\rangle=\left\{(0,0,0),\left(a_{0}, a_{1}, a_{2}\right)\right\} \equiv\left(a_{0}, a_{1}, a_{2}\right)$.
- $\mathrm{PG}(2,2)$ has 7 lines: $a_{0} X_{0}+a_{1} X_{1}+a_{2} X_{2}=0$.

Projective plane $\operatorname{PG}(2, q)$
Projective space $\mathrm{PG}(3, q)$ Blocking sets

Points and lines
Coordinates

## The plane PG(2, 3)

Finite fields

## Points and lines

Coordinates

## Properties of PG(2, 3)

- $P G(2,3)$ has 13 points.

Vector line
$\left\langle\left(a_{0}, a_{1}, a_{2}\right)\right\rangle=\left\{(0,0,0),\left(a_{0}, a_{1}, a_{2}\right), 2 \cdot\left(a_{0}, a_{1}, a_{2}\right)\right\}$.

- $\mathrm{PG}(2,3)$ has 13 lines: $a_{0} X_{0}+a_{1} X_{1}+a_{2} X_{2}=0$.

## NORMALIZED COORDINATES

- Projective point $=$ vector line $\left\langle\left(a_{0}, a_{1}, a_{2}\right)\right\rangle$.
- Select leftmost non-zero coordinate equal to one.
- Example: In PG(2,3),

Point $(2,2,0) \equiv(1,1,0)$.

## POINTS AND PLANES

## THEOREM

$P G(3, q)$ has $q^{3}+q^{2}+q+1$ points and $q^{3}+q^{2}+q+1$ planes.

## Proof:

- $\left(q^{4}-1\right) /(q-1)=q^{3}+q^{2}+q+1$ vector lines in $V(4, q)$.
- 3-dimensional vector space in $V(4, q)$ : $a_{0} X_{0}+a_{1} X_{1}+a_{2} X_{2}+a_{3} X_{3}=0$. $\left(q^{4}-1\right) /(q-1)=q^{3}+q^{2}+q+1$ 3-dimensional vector spaces in $V(4, q)$.

## Lines in PG $(3, q)$

## THEOREM

$P G(3, q)$ has $\left(q^{2}+1\right)\left(q^{2}+q+1\right)$ lines.
Proof: 2 points define a line, containing $q+1$ points. So

$$
\frac{\left(q^{3}+q^{2}+q+1\right)\left(q^{3}+q^{2}+q\right)}{(q+1) q}=\left(q^{2}+1\right)\left(q^{2}+q+1\right)
$$

lines in $\operatorname{PG}(3, q)$.

## Points on Lines

## THEOREM

(1) Two points in $P G(3, q)$ belong to unique line of $P G(3, q)$.
(2) Two lines in $P G(3, q)$ intersect in zero or one points.

## Proof:

- Two vector lines in $V(4, q)$ define unique vector plane in $V(4, q)$.
- Two vector planes in $V(4, q)$ intersect in unique vector line in $V(4, q)$, or only in zero vector.

Finite fields

Projective space PG $(3, q)$ Blocking sets

Points, lines, and planes
PG(3, 2)

## Points on Lines

## THEOREM

(1) Two planes in $P G(3, q)$ intersect in unique line of $P G(3, q)$.
(2) A line and a plane in $P G(3, q)$ intersect in one point if the line is not contained in this plane.

## Proof:

- Two 3-dimensional vector spaces in $V(4, q)$ intersect in unique vector plane in $V(4, q)$.
- Vector plane in $V(4, q)$ and 3 -dimensional vector space in $V(4, q)$ intersect in unique vector line in $V(4, q)$, if vector plane is not contained in 3 -dimensional vector space.

## Equations

## EQUations For lines and planes in PG $(3, q)$

- Plane: $a_{0} X_{0}+a_{1} X_{1}+a_{2} X_{2}+a_{3} X_{3}=0$.
- Line:

$$
\left\{\begin{array}{l}
a_{0} X_{0}+a_{1} X_{1}+a_{2} X_{2}+a_{3} X_{3}=0 \\
b_{0} X_{0}+b_{1} X_{1}+b_{2} X_{2}+b_{3} X_{3}=0
\end{array}\right.
$$

where $\left(a_{0}, a_{1}, a_{2}, a_{3}\right),\left(b_{0}, b_{1}, b_{2}, b_{3}\right) \neq(0,0,0,0)$ and where $\left(a_{0}, a_{1}, a_{2}, a_{3}\right) \neq \rho\left(b_{0}, b_{1}, b_{2}, b_{3}\right)$.

(4) BLOCKING SETS

## DEFINITION AND EXAMPLE

## DEFINITION

Blocking set $B$ in $\mathrm{PG}(2, q)$ is set of points, intersecting every line in at least one point.

## EXAMPLE

Line $L$ in $\operatorname{PG}(2, q)$.

## Example

$$
\operatorname{PG}(2, q)
$$

Leo Storme
Projective spaces

## DEFINITION

## DEFINITION

(1) Point $r$ of blocking set $B$ in $\operatorname{PG}(2, q)$ is essential if $B \backslash\{r\}$ is no longer blocking set.
(2) Tangent line $L$ to blocking set $B$ in $\operatorname{PG}(2, q)$ is line for which $|L \cap B|=1$.

## THEOREM

Point $r$ of blocking set $B$ is essential if and only if $r$ belongs to tangent line $L$ to $B$.

Finite fields
Projective plane PG(2,q)
Projective space PG(3, q)
Blocking sets
$P G(2, q)$

Finite fields

## Minimal BLOCKING SETS

## DEFINITION

Blocking set $B$ is minimal if and only if all of its points are essential.

## EXAMPLE

Line $L$ of $P G(2, q)$ is minimal blocking set $B$ of size $q+1$.

## BOSE-BURTON THEOREM

## THEOREM

For every blocking set $B$ in $P G(2, q),|B| \geq q+1$ and $|B|=q+1$ if and only if $B$ is equal to line $L$.

Proof: (1) Let $r \notin B$.

(2) Let $|B|=q+1$.

Part (1) shows that line $L$ not contained in $B$ only contains one point of $B$.
So, let $r_{1}, r_{2} \in B$, then line $r_{1} r_{2}$ contains at least 2 points of $B$, then $r_{1} r_{2} \subseteq B$.

## LOWER BOUND ON SIZE OF NON-TRIVIAL BLOCKING SET IN $\operatorname{PG}(2, q)$

## DEFINITION

Non-trivial blocking set $B$ in $\mathrm{PG}(2, q)$ does not contain a line.

## THEOREM

For non-trivial blocking set $B$ in $P G(2, q),|B| \geq q+\sqrt{q}+1$.

## Lower bound on size of non-trivial blocking SET IN $\operatorname{PG}(2, q)$

Proof: (1) Suppose some line $L$ contains more than $\sqrt{q}+1$ points of $B$, then $|B|>q+\sqrt{q}+1$.

## Lower bound on size of non-trivial blocking SET IN $\operatorname{PG}(2, q)$

(2) From now on, assume every line contains at most $\sqrt{9}+1$ points of $B$.
Let $\tau_{i}$ be number of $i$-secants to $B$; let $n$ be largest number of points of $B$ on line of $\operatorname{PG}(2, q)$. Then

## LOWER BOUND ON SIZE OF NON-TRIVIAL BLOCKING SET IN PG(2, q)

$$
\begin{align*}
\sum_{i=1}^{n} \tau_{i} & =q^{2}+q+1  \tag{1}\\
\sum_{i=1}^{n} i \tau_{i} & =|B|(q+1)  \tag{2}\\
\sum_{i=2}^{n} i(i-1) \tau_{i} & =|B|(|B|-1) \tag{3}
\end{align*}
$$

## LOWER BOUND ON SIZE OF NON-TRIVIAL BLOCKING $\operatorname{SET} \operatorname{IN} \operatorname{PG}(2, q)$

Meaning of (1), (2), and (3):
(1) number of lines in $\operatorname{PG}(2, q)$,
(2) count pairs $(P, \ell)$, with $P \in B$, line $\ell$, and $P \in \ell$,
(3) count triples $\left(P, P^{\prime}, \ell\right)$, with $P, P^{\prime} \in B, P \neq P^{\prime}$, line $\ell$, and $P, P^{\prime} \in \ell$.

## LOWER BOUND ON SIZE OF NON-TRIVIAL BLOCKING SET IN $\operatorname{PG}(2, q)$

Since $1 \leq|L \cap B| \leq n \leq \sqrt{q}+1$, for all lines $L$,

$$
\begin{aligned}
\sum_{i=1}^{n}(i-1)(i-\sqrt{q}-1) \tau_{i} & \leq 0, \\
\sum_{i=1}^{n} i(i-1) \tau_{i}-(\sqrt{q}+1) \sum_{i=1}^{n} i \tau_{i}+(\sqrt{q}+1) \sum_{i=1}^{n} \tau_{i} & \leq 0, \\
|B|(|B|-1)-(\sqrt{q}+1)|B|(q+1)+ & \\
(\sqrt{q}+1)\left(q^{2}+q+1\right) & \leq 0, \\
(|B|-(q+\sqrt{q}+1))(|B|-(q \sqrt{q}+1)) & \leq 0 .
\end{aligned}
$$

So $|B| \geq q+\sqrt{q}+1$.

Finite fields
Projective plane PG(2, q)

## GENERAL BLOCKING SETS

## DEFINITION

Blocking set $B$ in $P G(n, q)$ with respect to $k$-subspaces is set of points, intersecting every $k$-subspace in at least one point.

## EXAMPLE <br> $(n-k)$-dimensional subspace $\mathrm{PG}(n-k, q)$ in $\mathrm{PG}(n, q)$.

## BOSE-BURTON THEOREM

## THEOREM

For every blocking set $B$ in $P G(n, q)$, with respect to the
$k$-subspaces, $|B| \geq P G(n-k, q)$ and $|B|=|P G(n-k, q)|$ if and only if $B$ is equal to $(n-k)$-dimensional subspace $P G(n-k, q)$.

## Thank you very much for your attention!
